

Metadata of Datasate

Dataset Purpose

This dataset represents a relational database for a **Food Delivery Platform** called **Quick Express**. It is designed to track and analyze the entire order lifecycle, from customer acquisition and menu management to order processing, delivery logistics, and post-order customer feedback. It enables analysis of sales performance, operational efficiency (delivery times, preparation times), customer behavior, and partner performance (restaurants and delivery agents).

1. Dimension Tables (Static Data)

dim_customer.csv

Purpose: Contains profile information for registered customers.

customer_id	Unique identifier for each customer (Primary Key).
signup_date	The date the customer registered on the platform.
acquisition_channel	The marketing channel through which the customer was acquired (e.g., Organic, Paid, Referral).

dim_restaurant.csv

Purpose: Stores details about the restaurants listed on the platform.

restaurant_id	Unique identifier for each restaurant (Primary Key).
restaurant_name	Commercial name of the restaurant.
city	The city where the restaurant operates.
cuisine_type	The primary type of cuisine offered (e.g., Chinese, North Indian, Pizza).
partner_type	The business model (e.g., Restaurant, Cloud Kitchen).
avg_prep_time_min	Average time range taken to prepare food (e.g., "16-25", "26-40").
is_active	Indicator if the restaurant is currently active on the platform (Y/N).

dim_delivery_partner.csv

Purpose: Contains profile and performance data for delivery drivers/riders.

delivery_partner_id	Unique identifier for the delivery partner (Primary Key).
partner_name	Name of the delivery partner.
vehicle_type	The mode of transport used (e.g., Bike, Scooter, Cycle, Car).
employment_type	The nature of their employment (e.g., Full-time, Part-time, Contract).
avg_rating	The historical average rating of the partner.
is_active	Indicator if the partner is currently active (Y/N).

dim_menu_item.csv

Purpose: A catalog of all food items available across different restaurants.

menu_item_id	Unique identifier for a specific menu item (Primary Key).
restaurant_id	Foreign Key linking to the dim_restaurant table.
item_name	Name of the food item (e.g., "Paneer Tikka Pizza").
category	The classification of the item (e.g., Starters, Main Course, Beverages).
is_veg	Indicator if the item is vegetarian (Y/N).
price	The listed price of the item.

2. Fact Tables (Transactional Data)

fact_orders.csv

Purpose: The central table recording every order placed by a customer.

order_id	Unique identifier for the order (Primary Key).
customer_id	Link to dim_customer.
restaurant_id	Link to dim_restaurant.
delivery_partner_id	Link to dim_delivery_partner.
order_timestamp	Date and time when the order was placed.
subtotal_amount	The cost of food items before taxes/fees.
discount_amount	Total discount applied to the order.
delivery_fee	The fee charged for delivery.
total_amount	Final amount paid by customer (<i>subtotal - discount + delivery</i>).
is_cod	Indicator if the payment method was Cash on Delivery (Y/N).
is_cancelled	Indicator if the order was cancelled (Y/N).

fact_order_items.csv

Purpose: A detailed breakdown of items within each order (one row per item per order).

order_id	Link to the parent order in fact_orders.
item_id	A sequential ID for the item within that specific order.
menu_item_id	Link to dim_menu_item to identify the product.
restaurant_id	Link to dim_restaurant.
quantity	The number of units ordered.
unit_price	The price per single unit.
item_discount	Discount applicable specifically to this line item.
line_total	Total cost for this line (<i>quantity * unit_price - item_discount</i>).

fact_delivery_performance.csv

Purpose: Tracks the logistical efficiency of each order's delivery.

order_id	Link to fact_orders.
actual_delivery_time	The actual time taken (in minutes) to deliver the order.
expected_delivery_time	The estimated time (ETA) provided to the customer in minutes.
distance_km	The distance traveled for the delivery in kilometers.

fact_ratings.csv

Purpose: Captures customer feedback and sentiment after order completion.

order_id	Link to fact_orders.
customer_id	Link to dim_customer.
restaurant_id	Link to dim_restaurant.
rating	The numerical score given by the customer (e.g., 1 to 5).
review_text	The written feedback provided by the customer.
review_timestamp	Time when the review was submitted.
sentiment_score	A derived numerical score indicating the sentiment of the text.
